Sign in to MediVault

Secure entry to the system

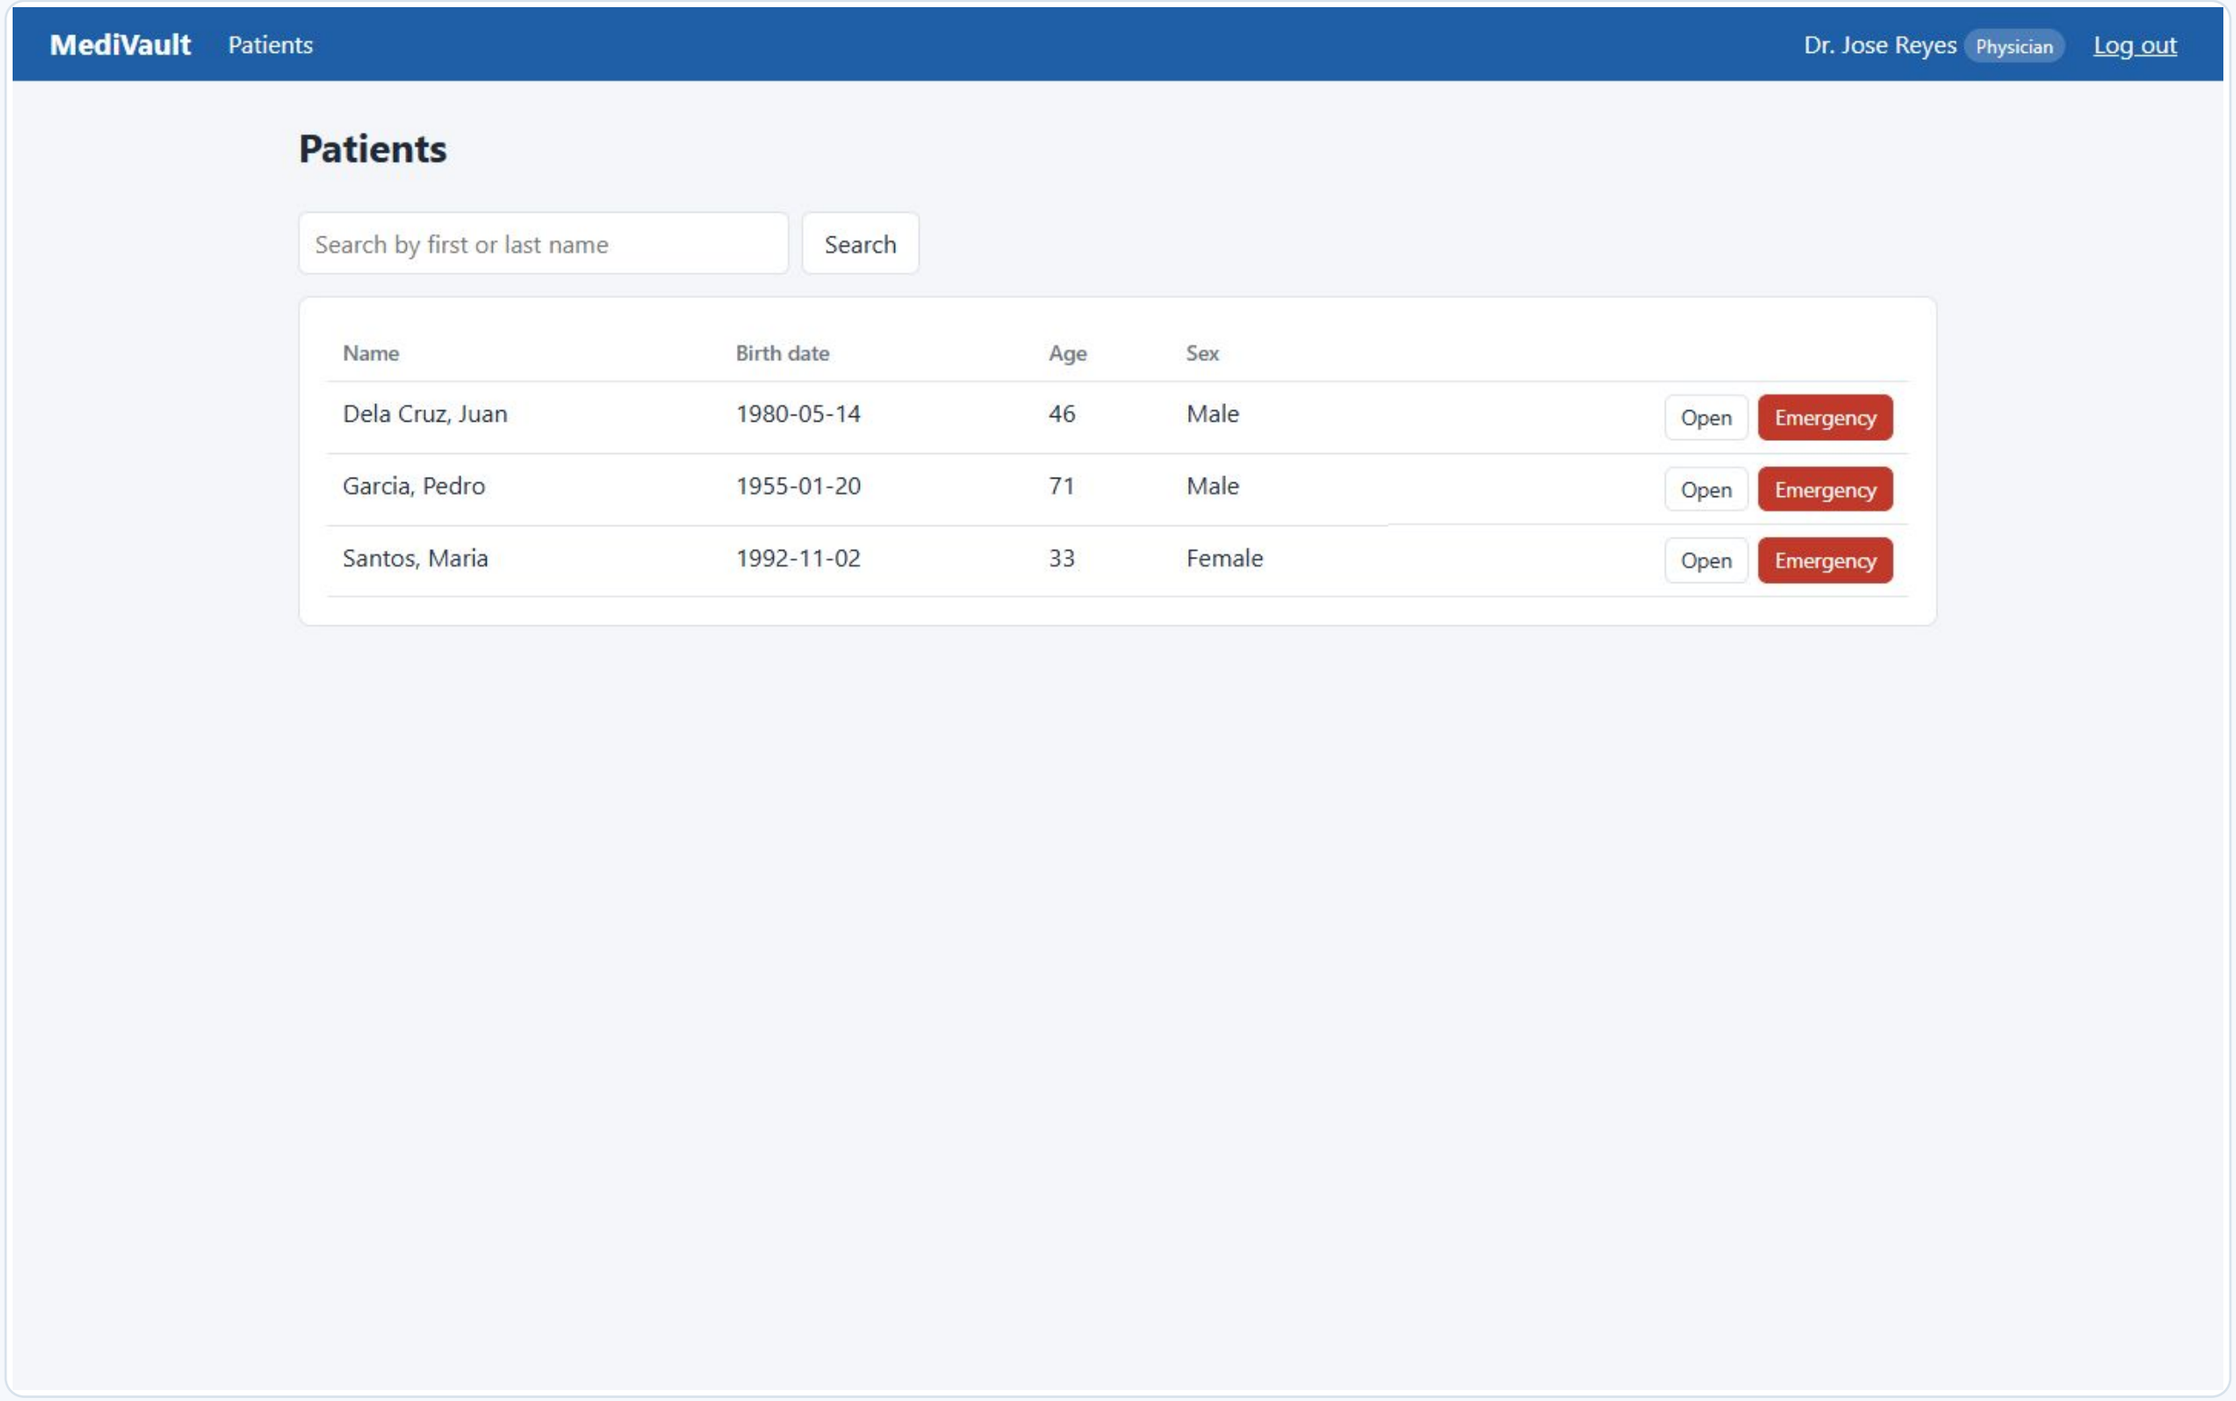

Enter your assigned username and password, then select **Log in**. The landing page and available controls depend on your role.

The screenshots use the fictional records and accounts supplied in seed.py.

Find a patient

Search and open patient records

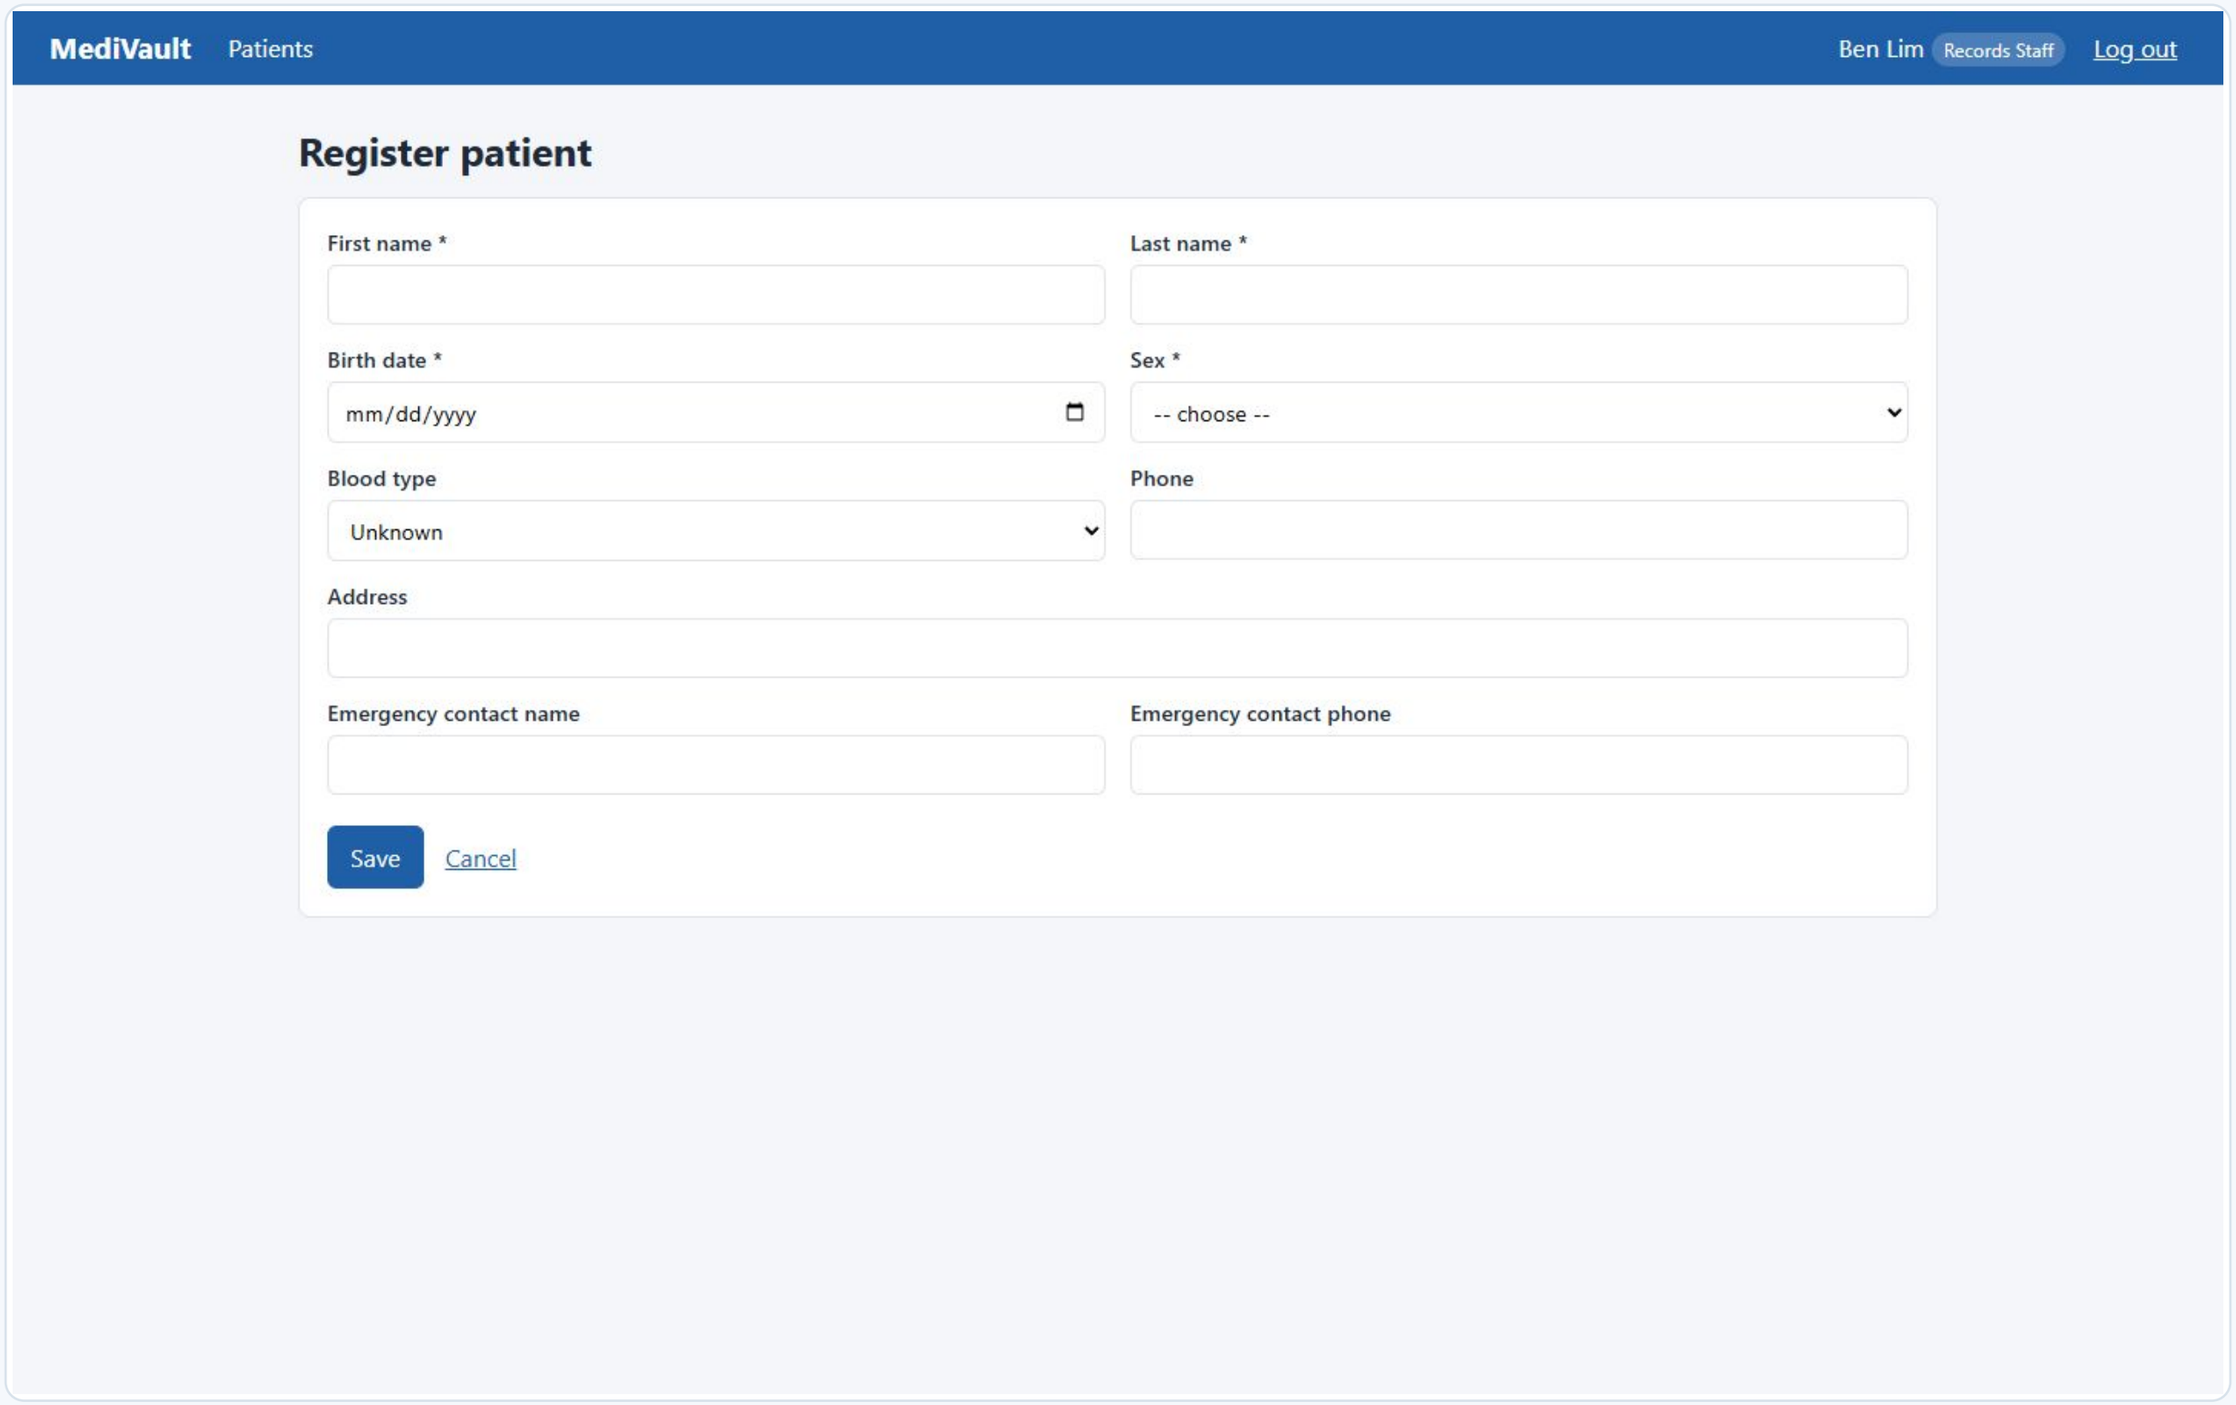

Select **Patients**, enter a name in the search box, and select **Search**. Choose **Open** to view a chart, or **Emergency** when your role permits it.

The physician view shows routine and emergency entry points.

Register a patient

Records Staff workflow

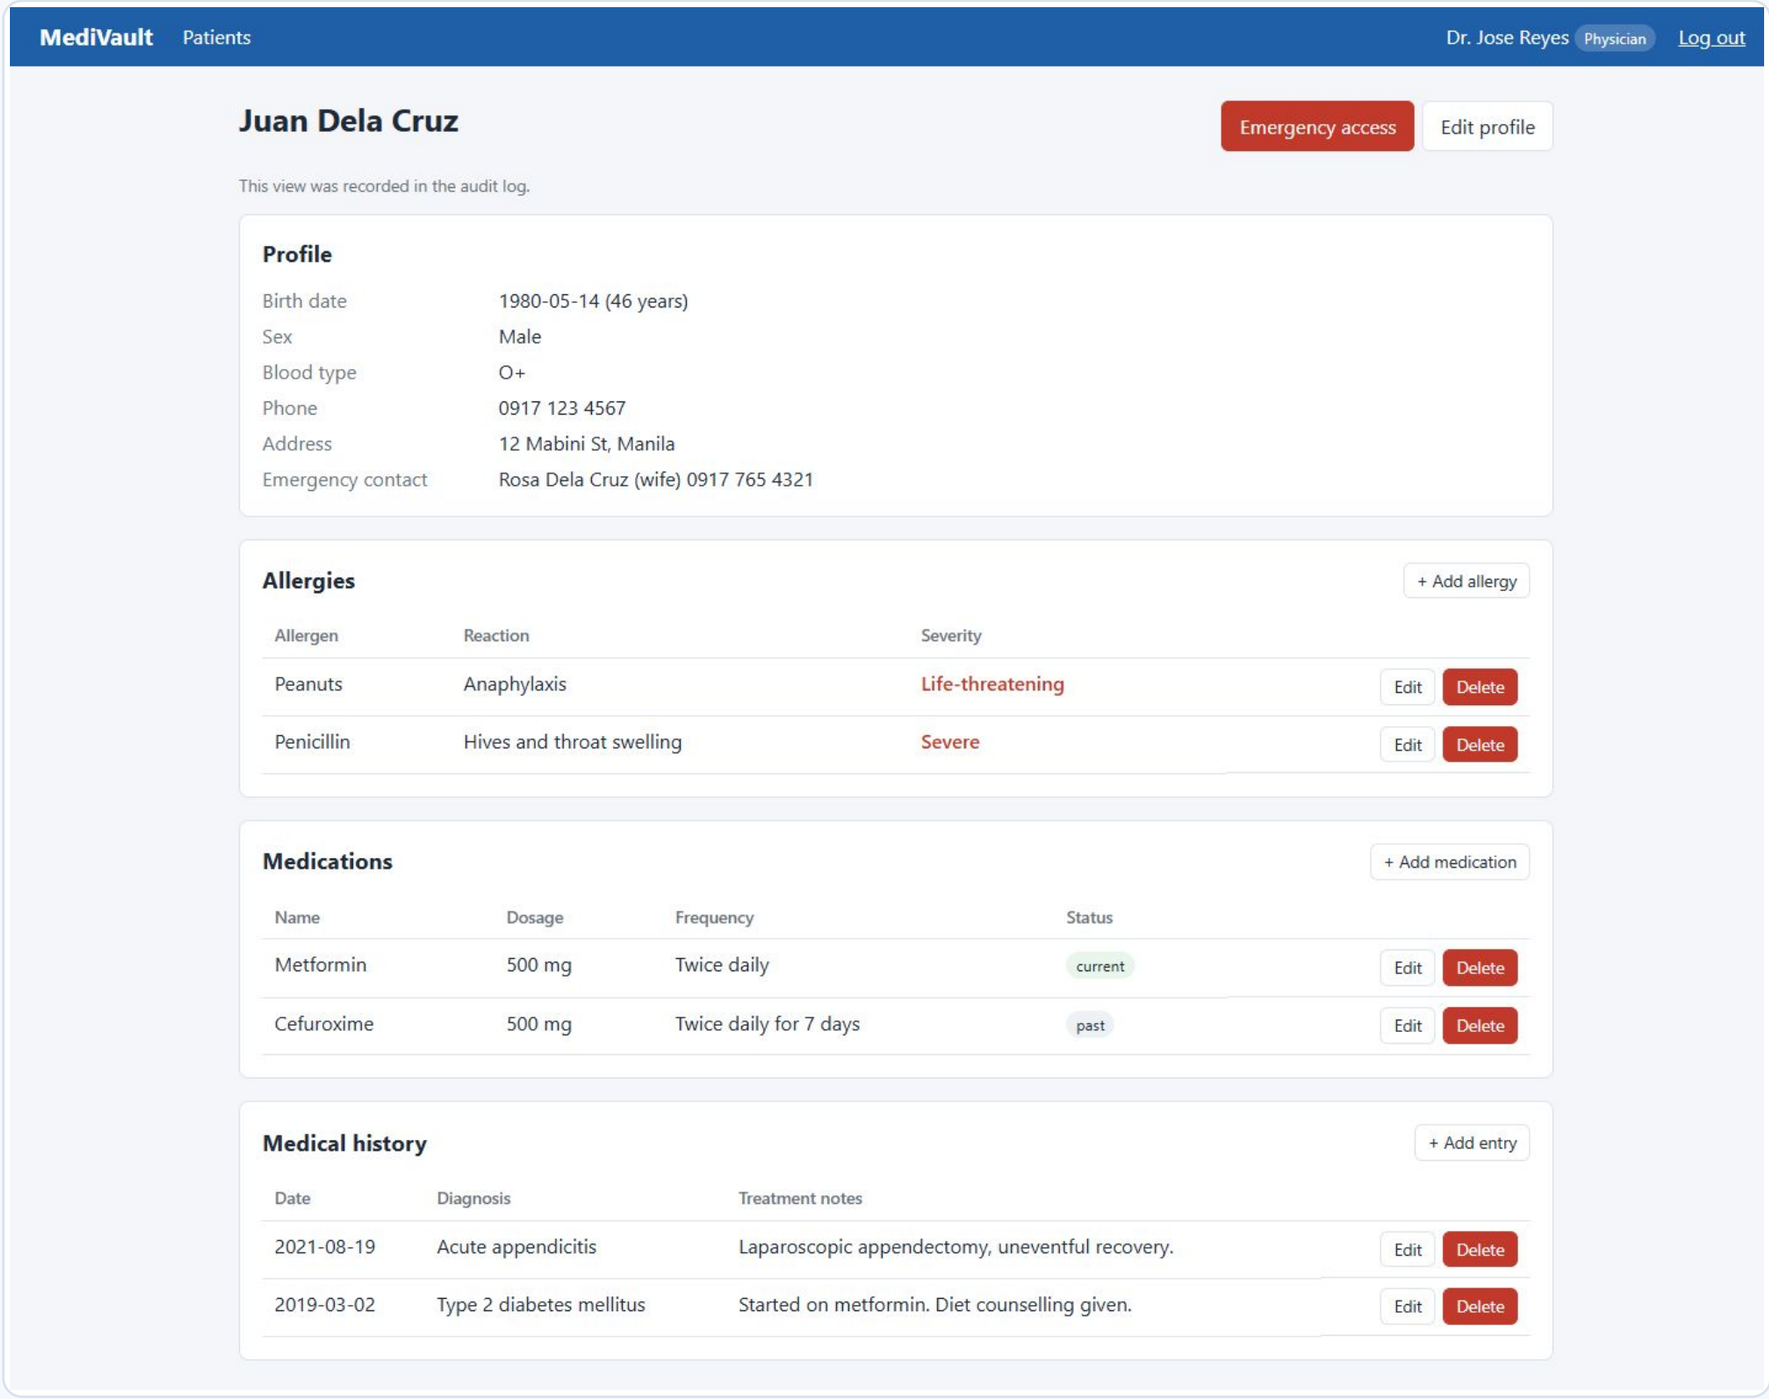

Sign in as Records Staff and select **+ Register patient**. Fill in first name, last name, birth date, and sex. Add contact details and select **Save**.

Fields marked * are required. Cancel returns to the patient list.

Read the clinical chart

Physician view of the complete patient record

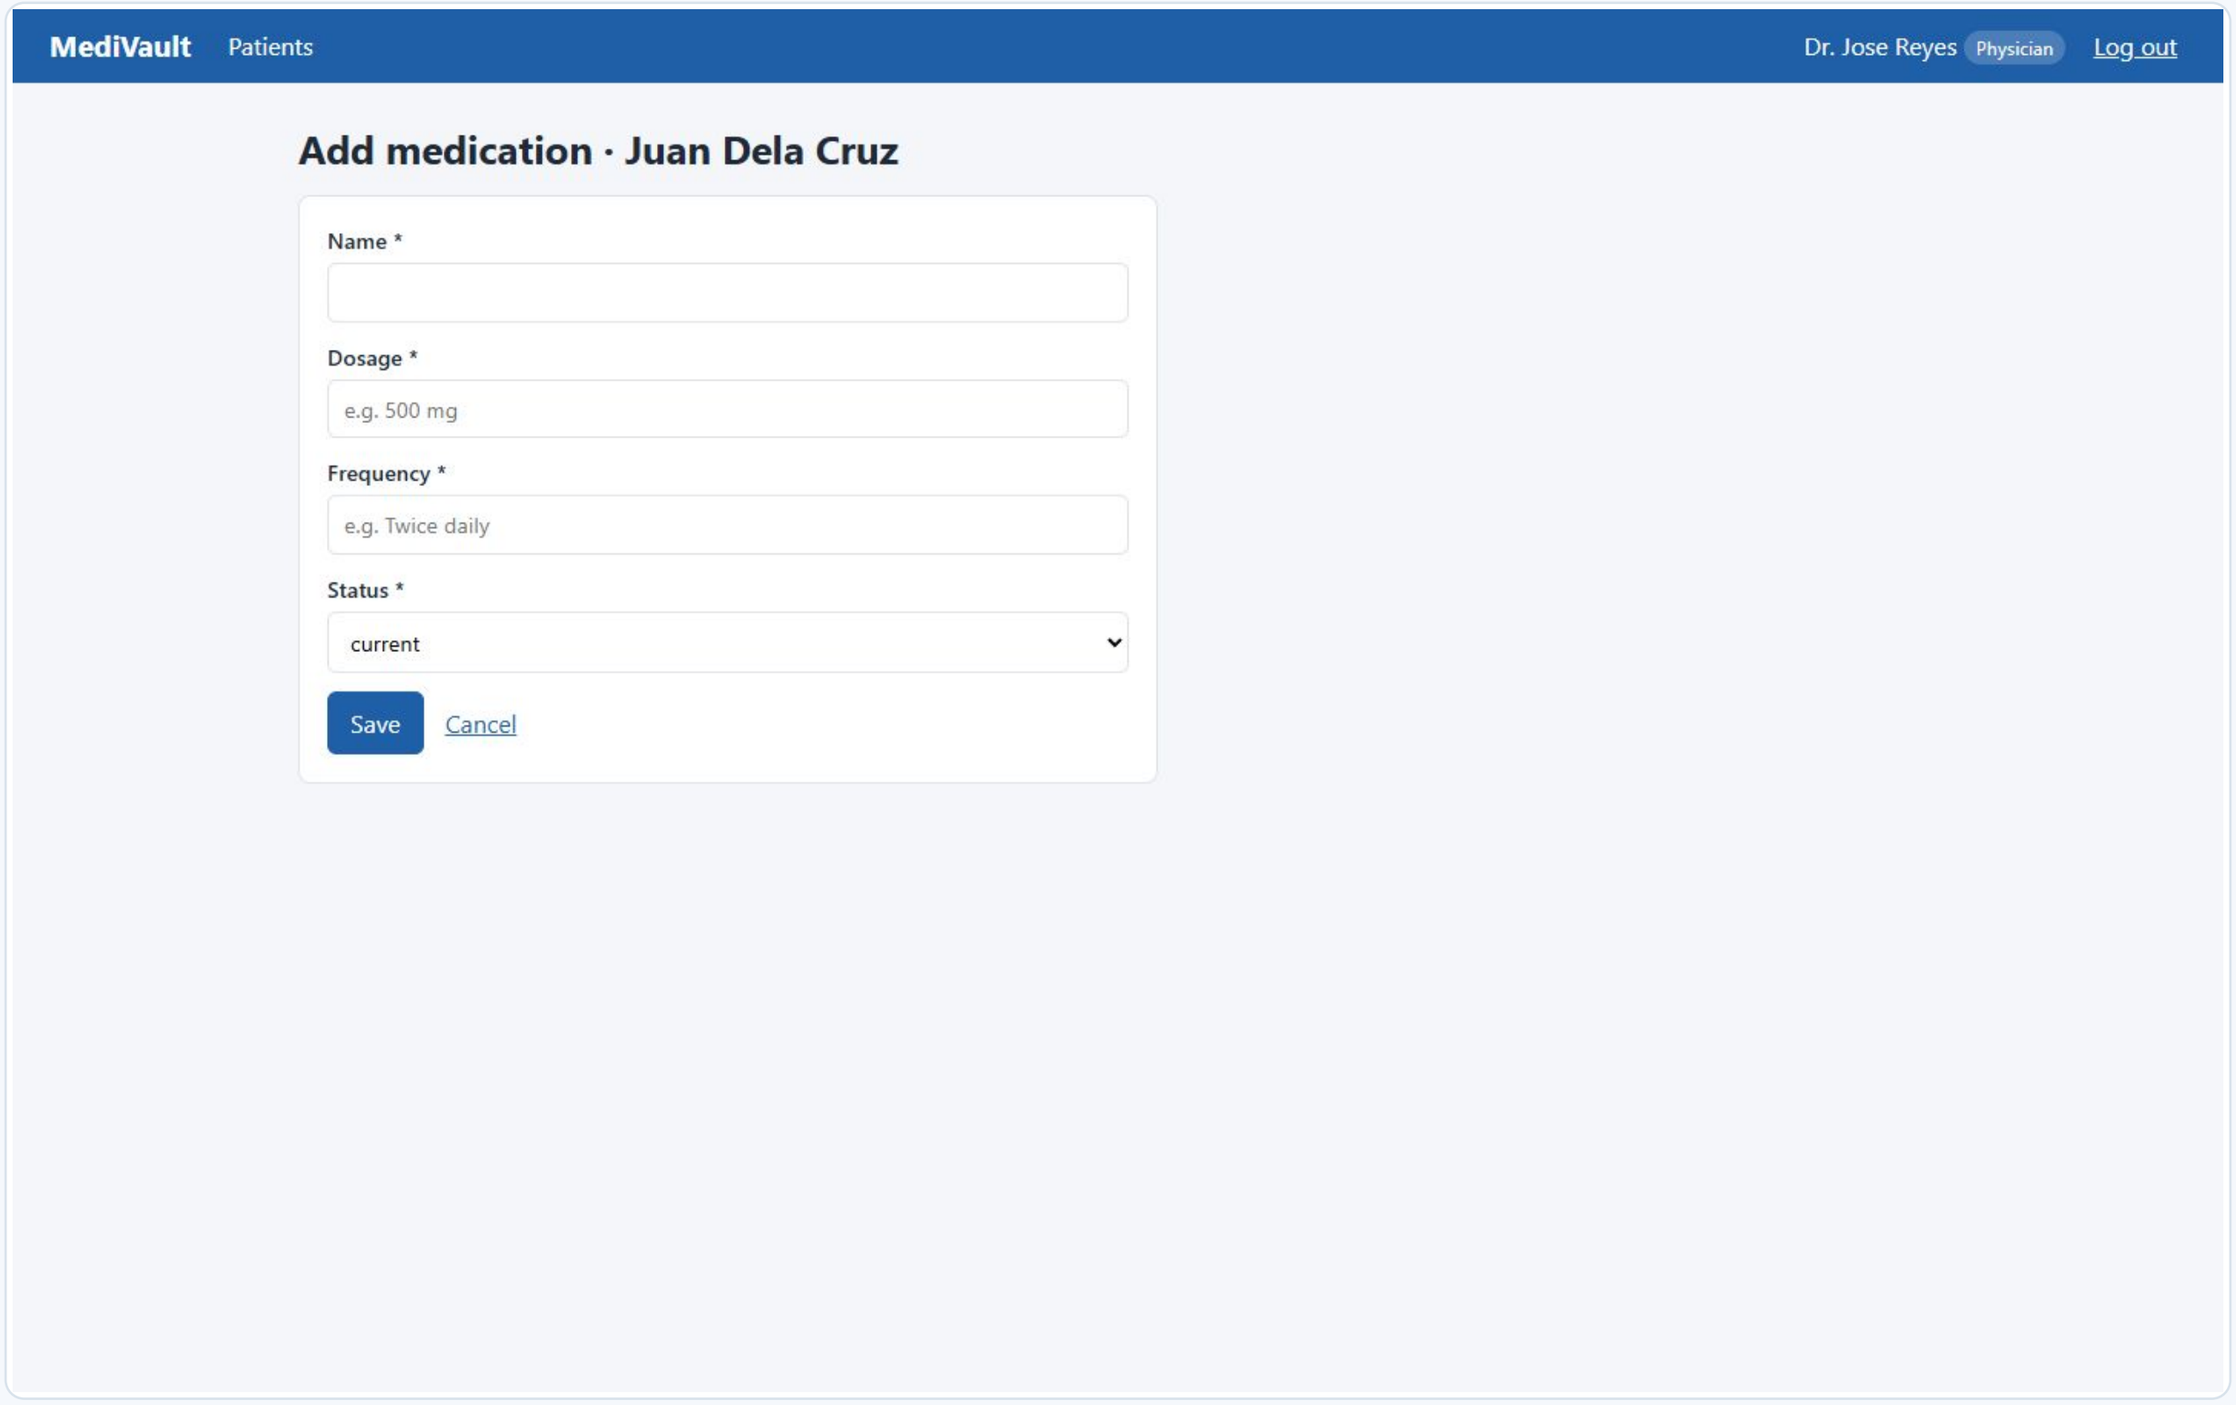

Open a patient as a physician to see the profile, allergies, medications, and medical history. Use the section-specific **Add** or **Edit** controls to update permitted records.

Medication status distinguishes current treatment from past treatment.

Add a medication

A simple clinical data-entry form

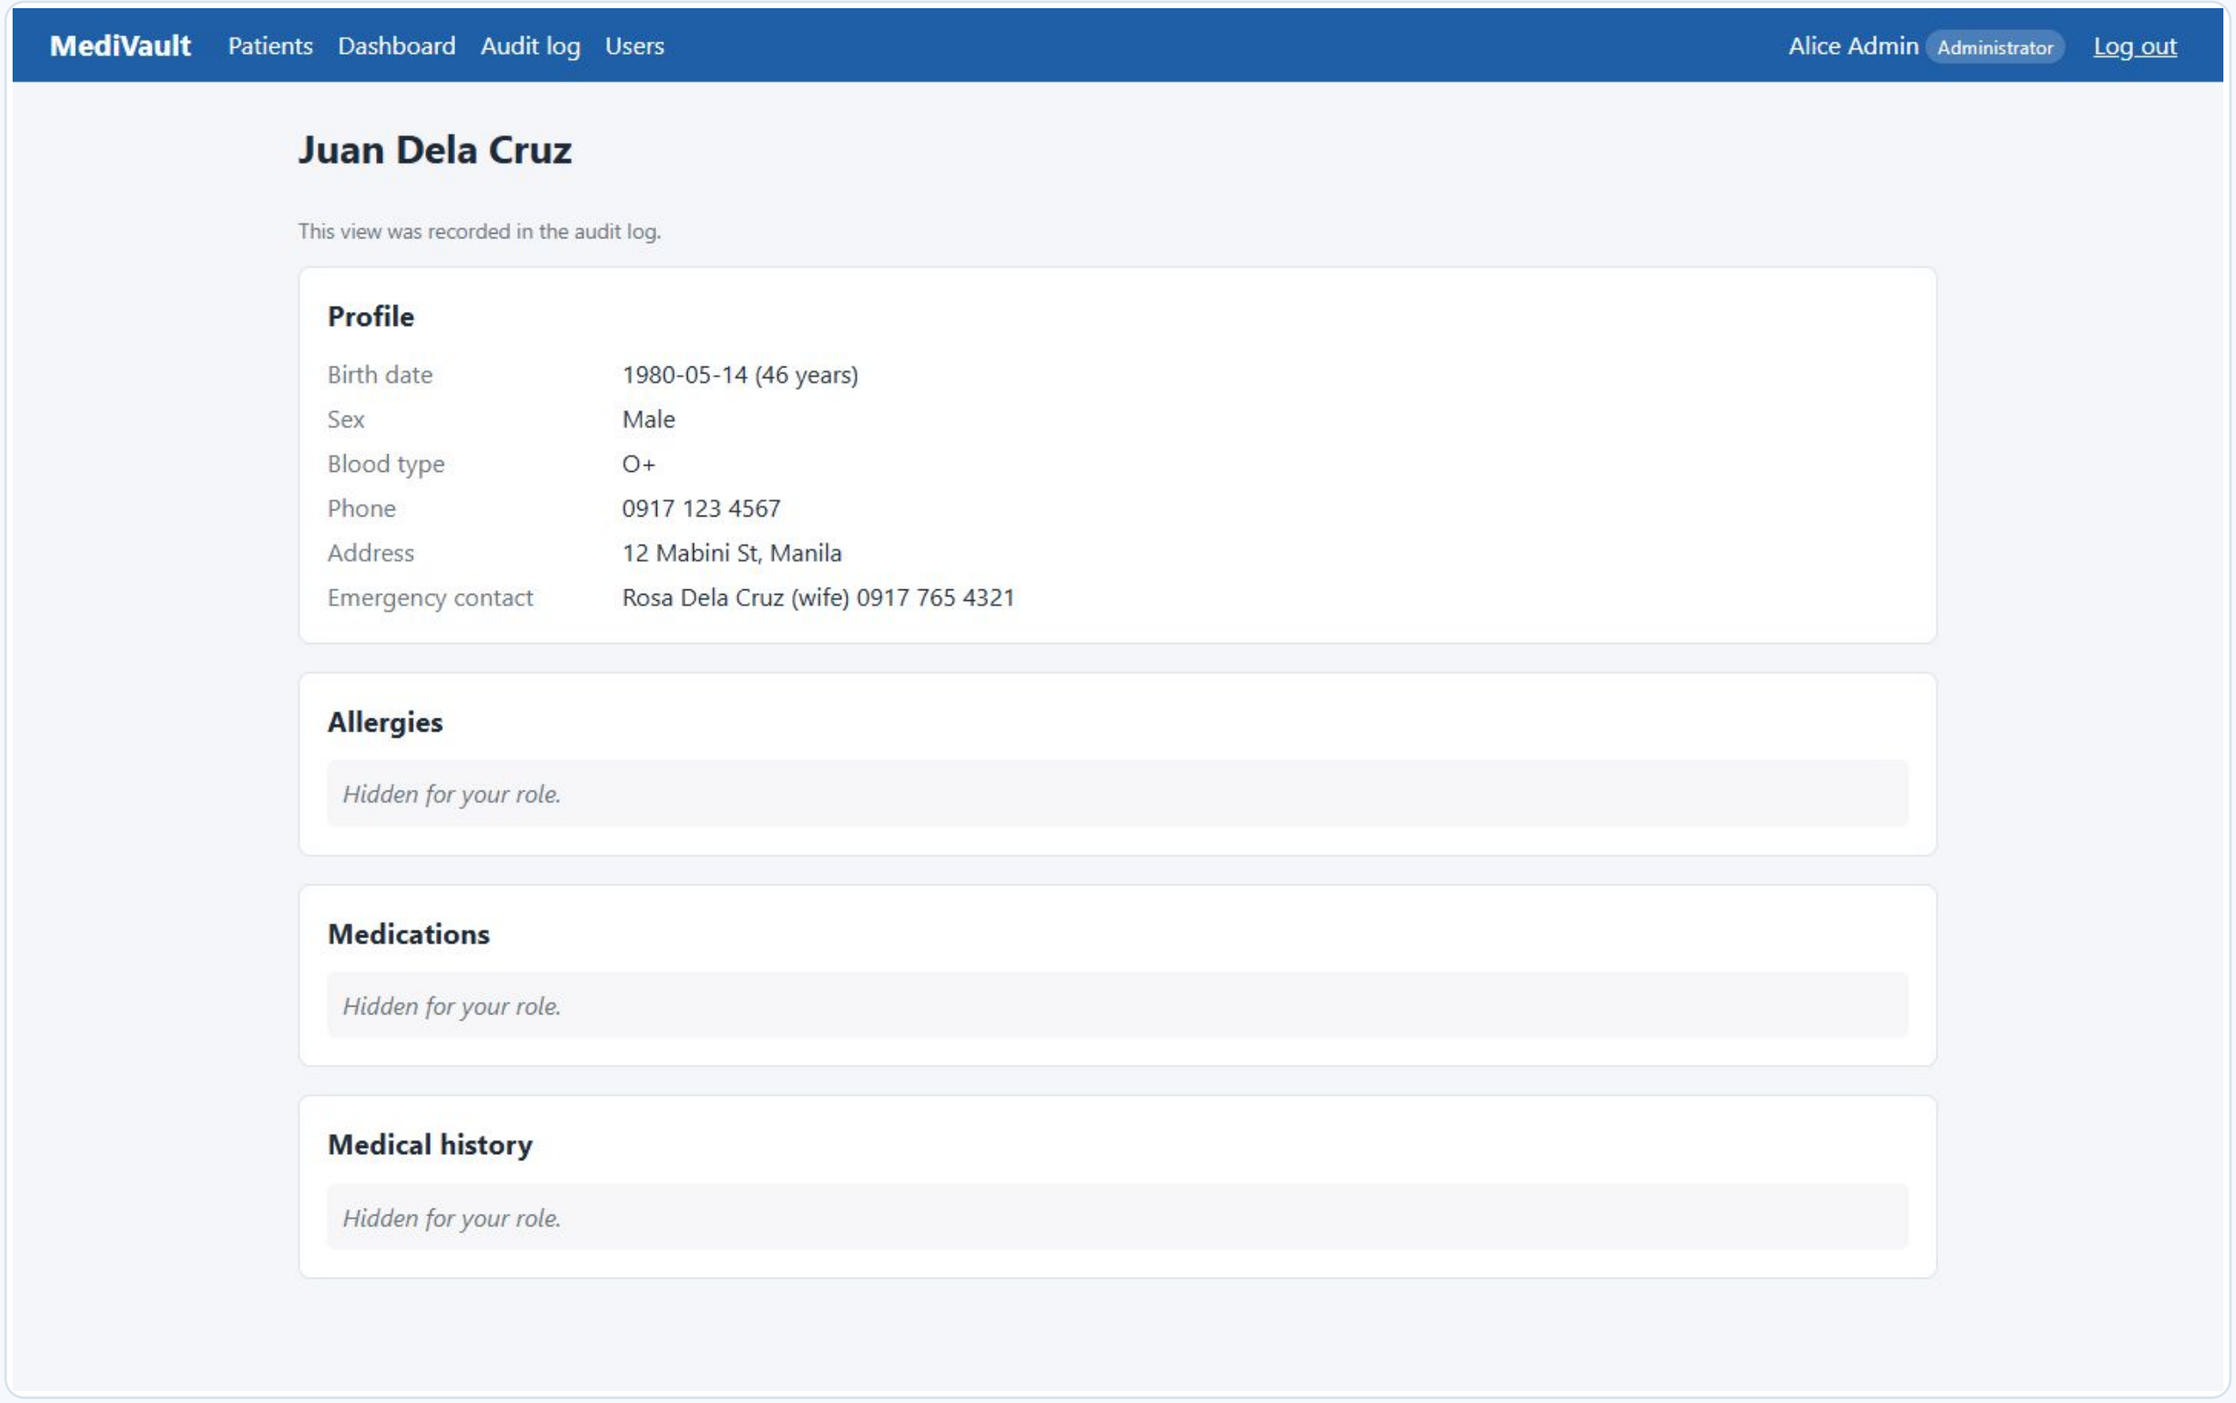

From the patient chart, select **+ Add medication**. Enter the name, dosage, and frequency; choose **current** or **past**; then select **Save**.

Physicians and nurses can maintain medications. This screenshot shows the form without changing a record.

Respect role permissions

Administrator view with clinical sections hidden

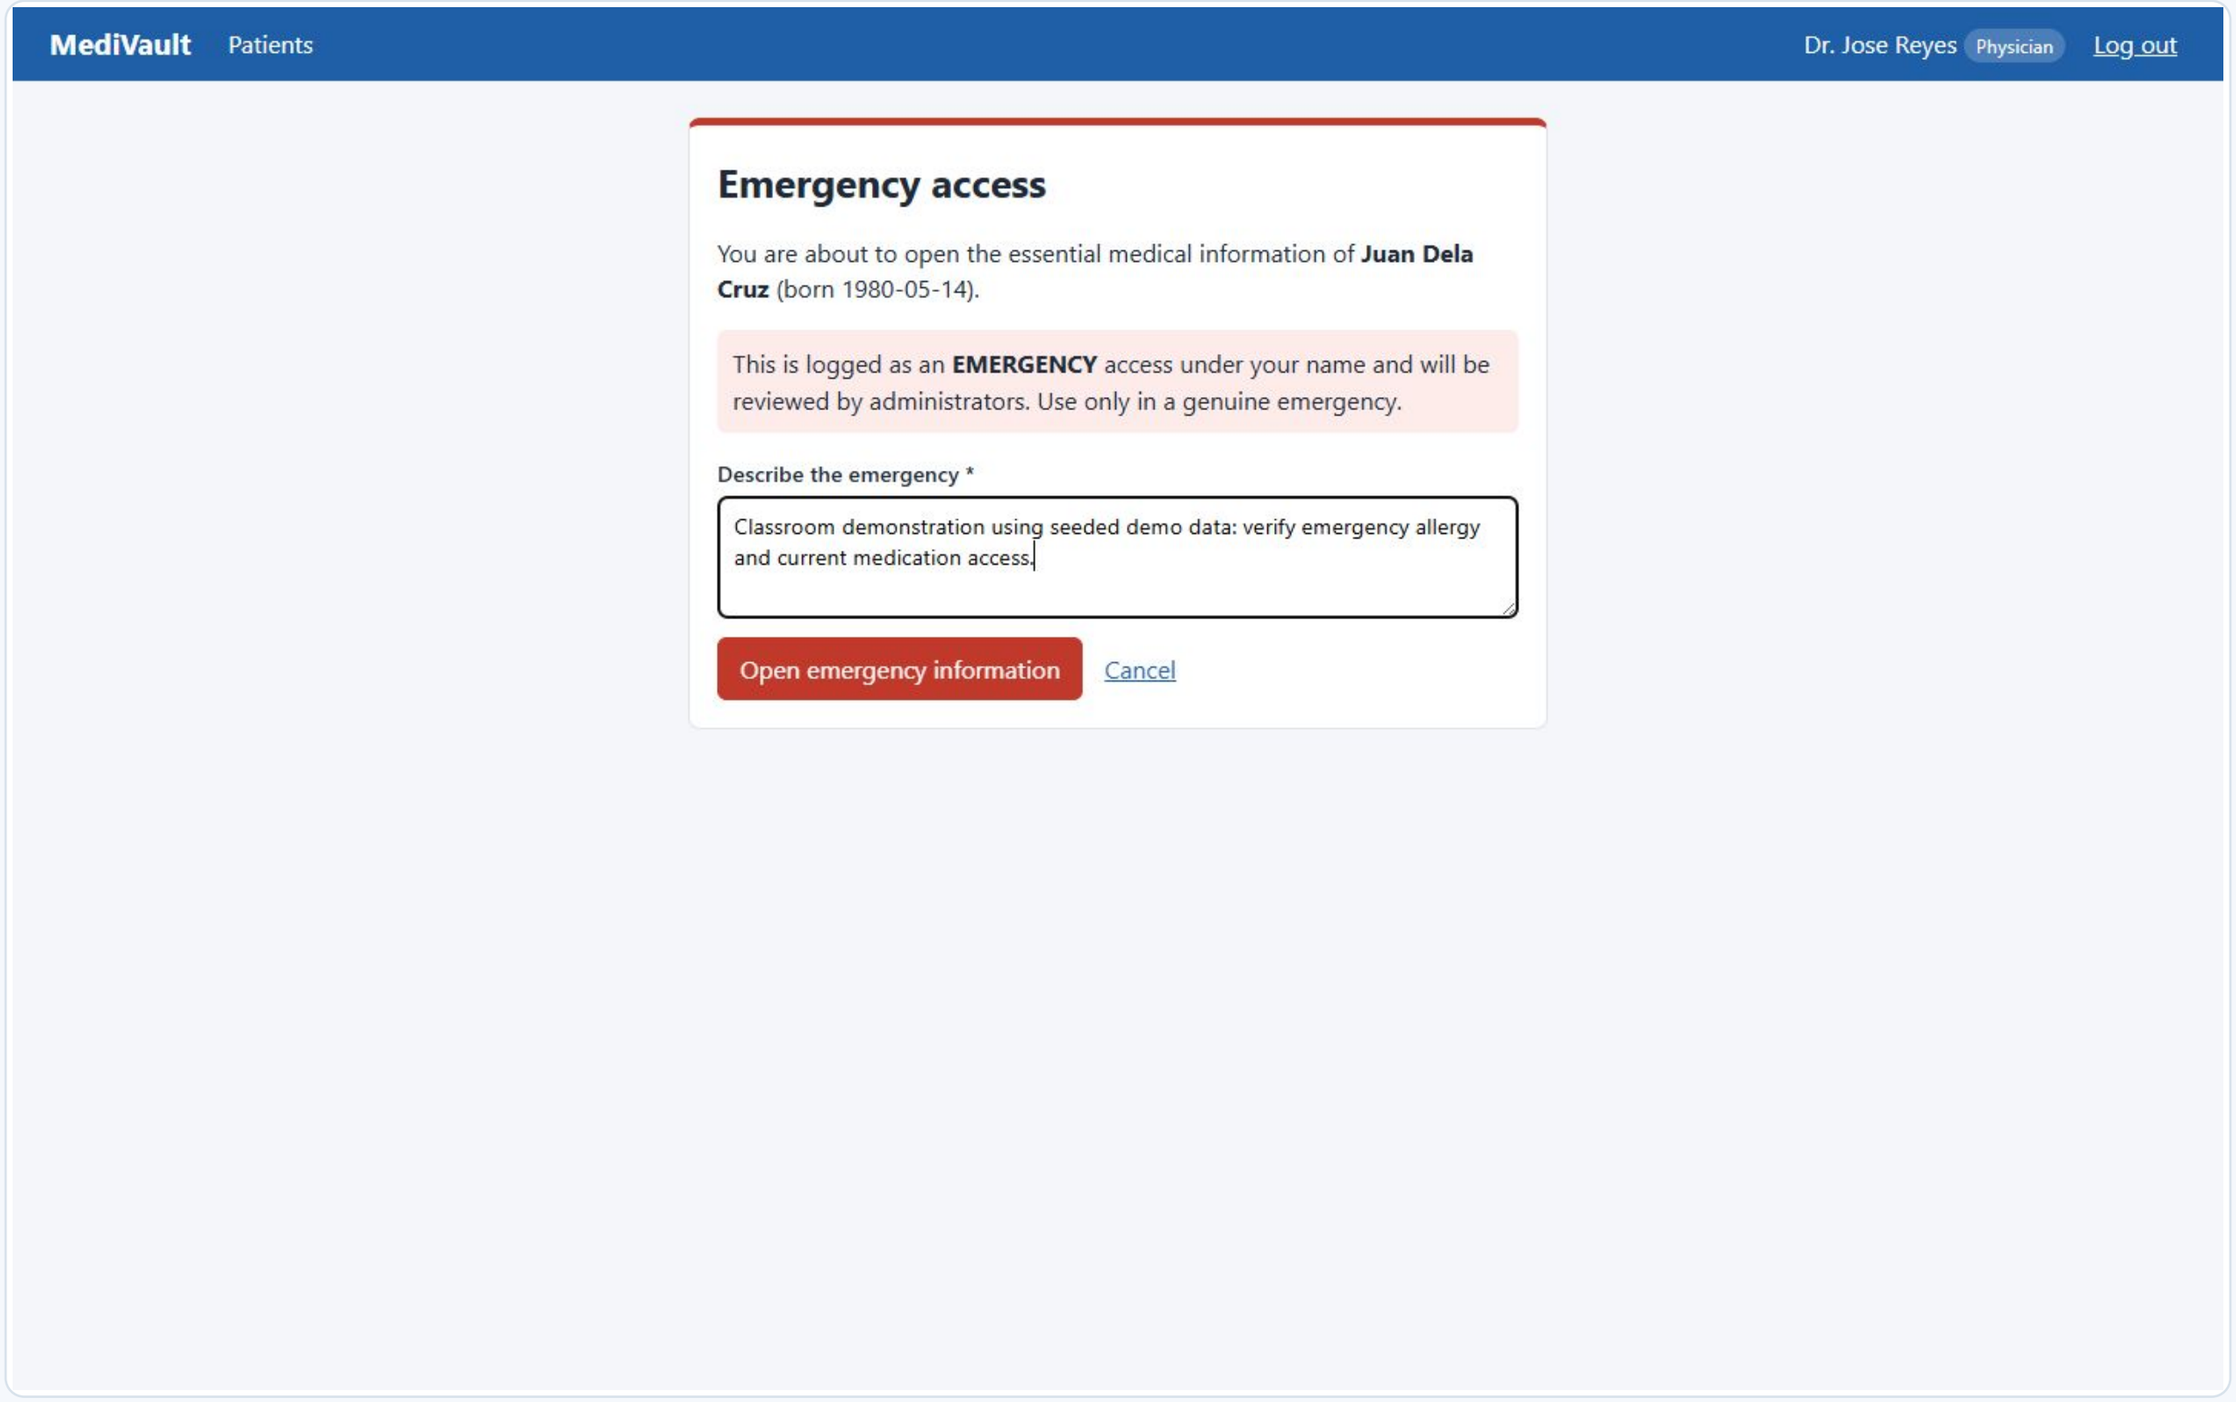

When a section says **Hidden for your role**, use an account with the appropriate assigned role. Administrators manage oversight and staff accounts; their default role cannot read clinical sections.

Records Staff can maintain patient profiles but cannot read allergies, medications, or medical history.

Give a reason for emergency access

Accountable access to essential information

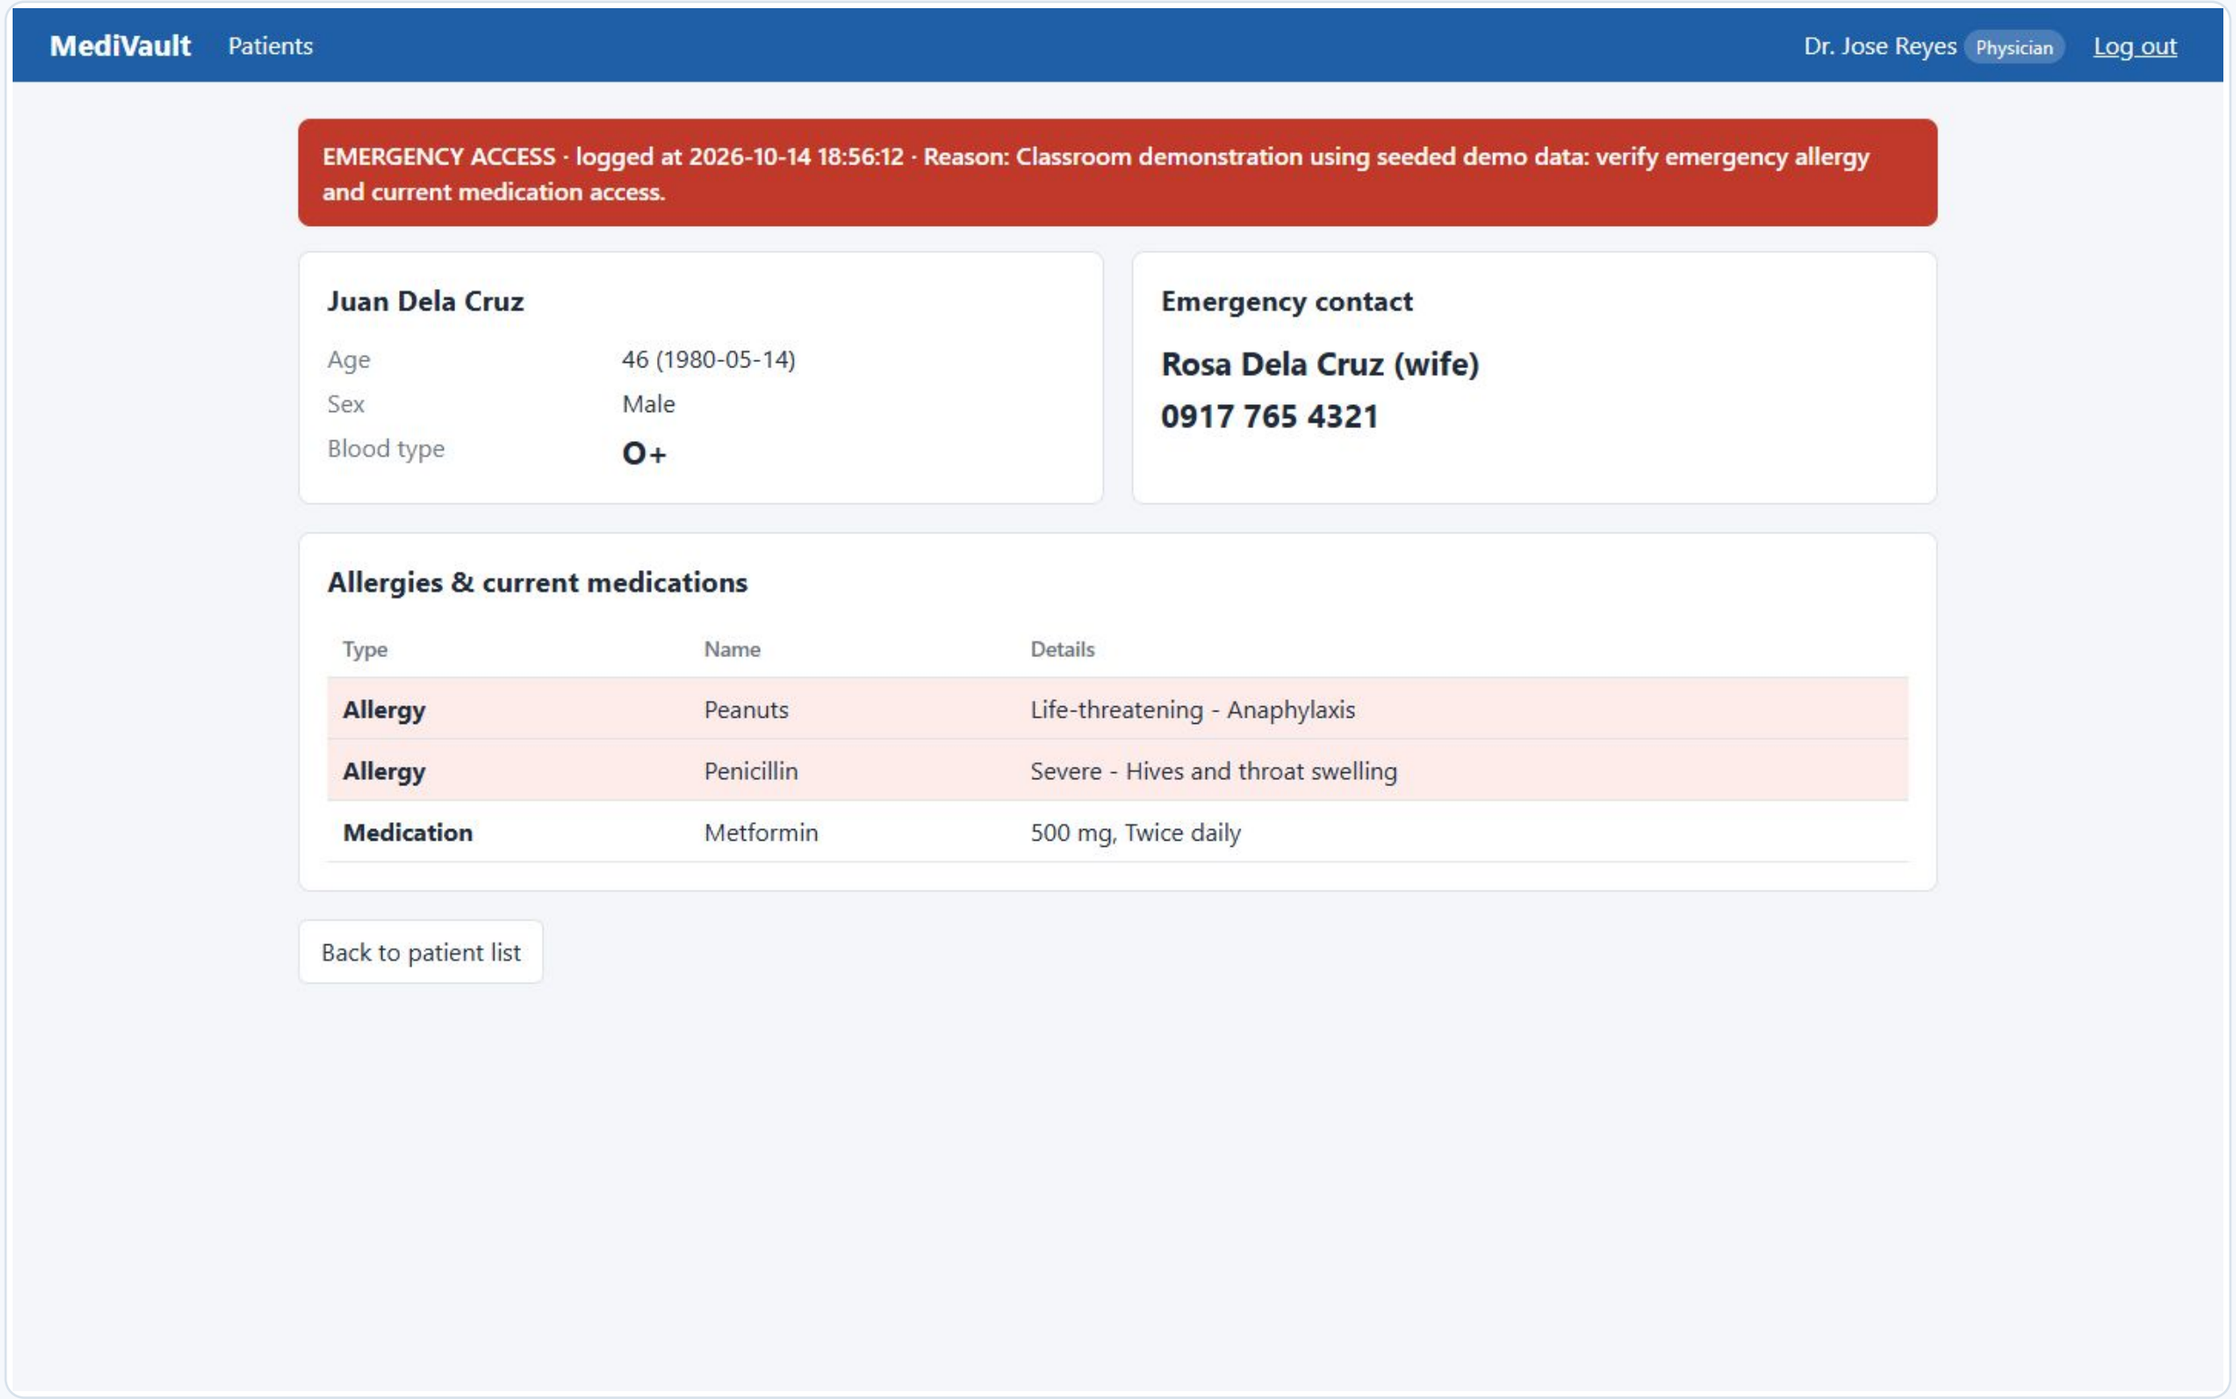

Select **Emergency** or **Emergency access**. Describe the emergency using at least 10 characters, then select **Open emergency information**.

This capture uses an explicitly labelled classroom demonstration reason with seeded demo data.

View emergency essentials

Allergies, current medications, and emergency contact

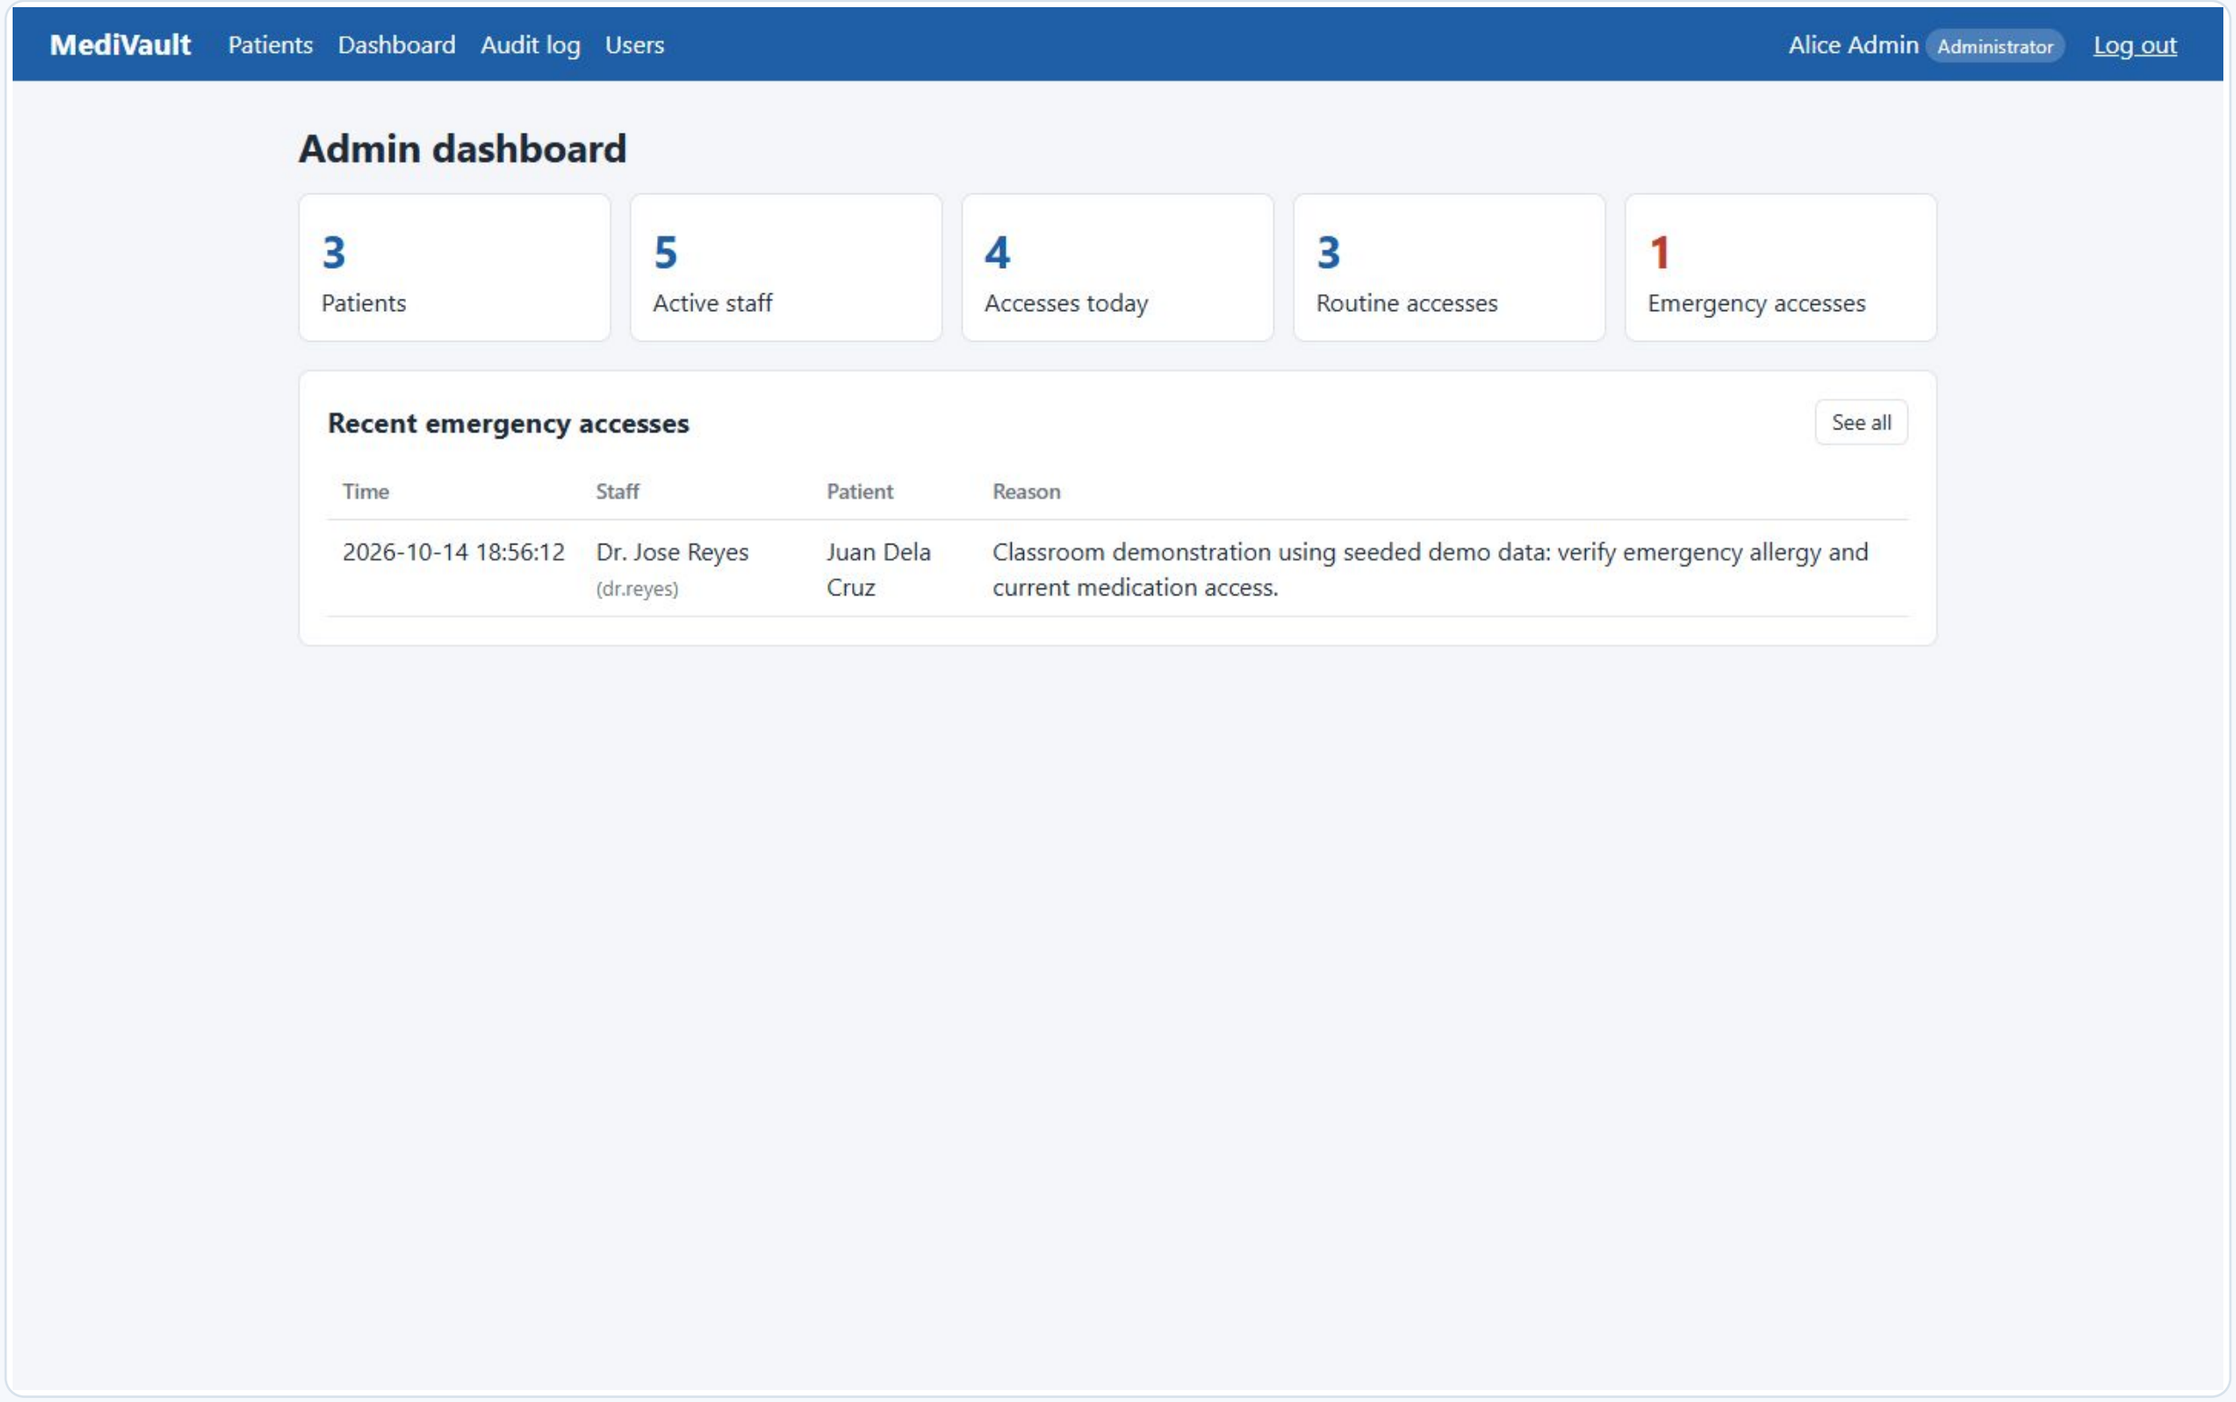

Review the patient identity, blood type, emergency contact, allergies, and current medications. Select **Back to patient list** when finished.

The emergency view excludes past medications and medical history. The reason and access time are recorded.

Monitor the dashboard

Administrator overview

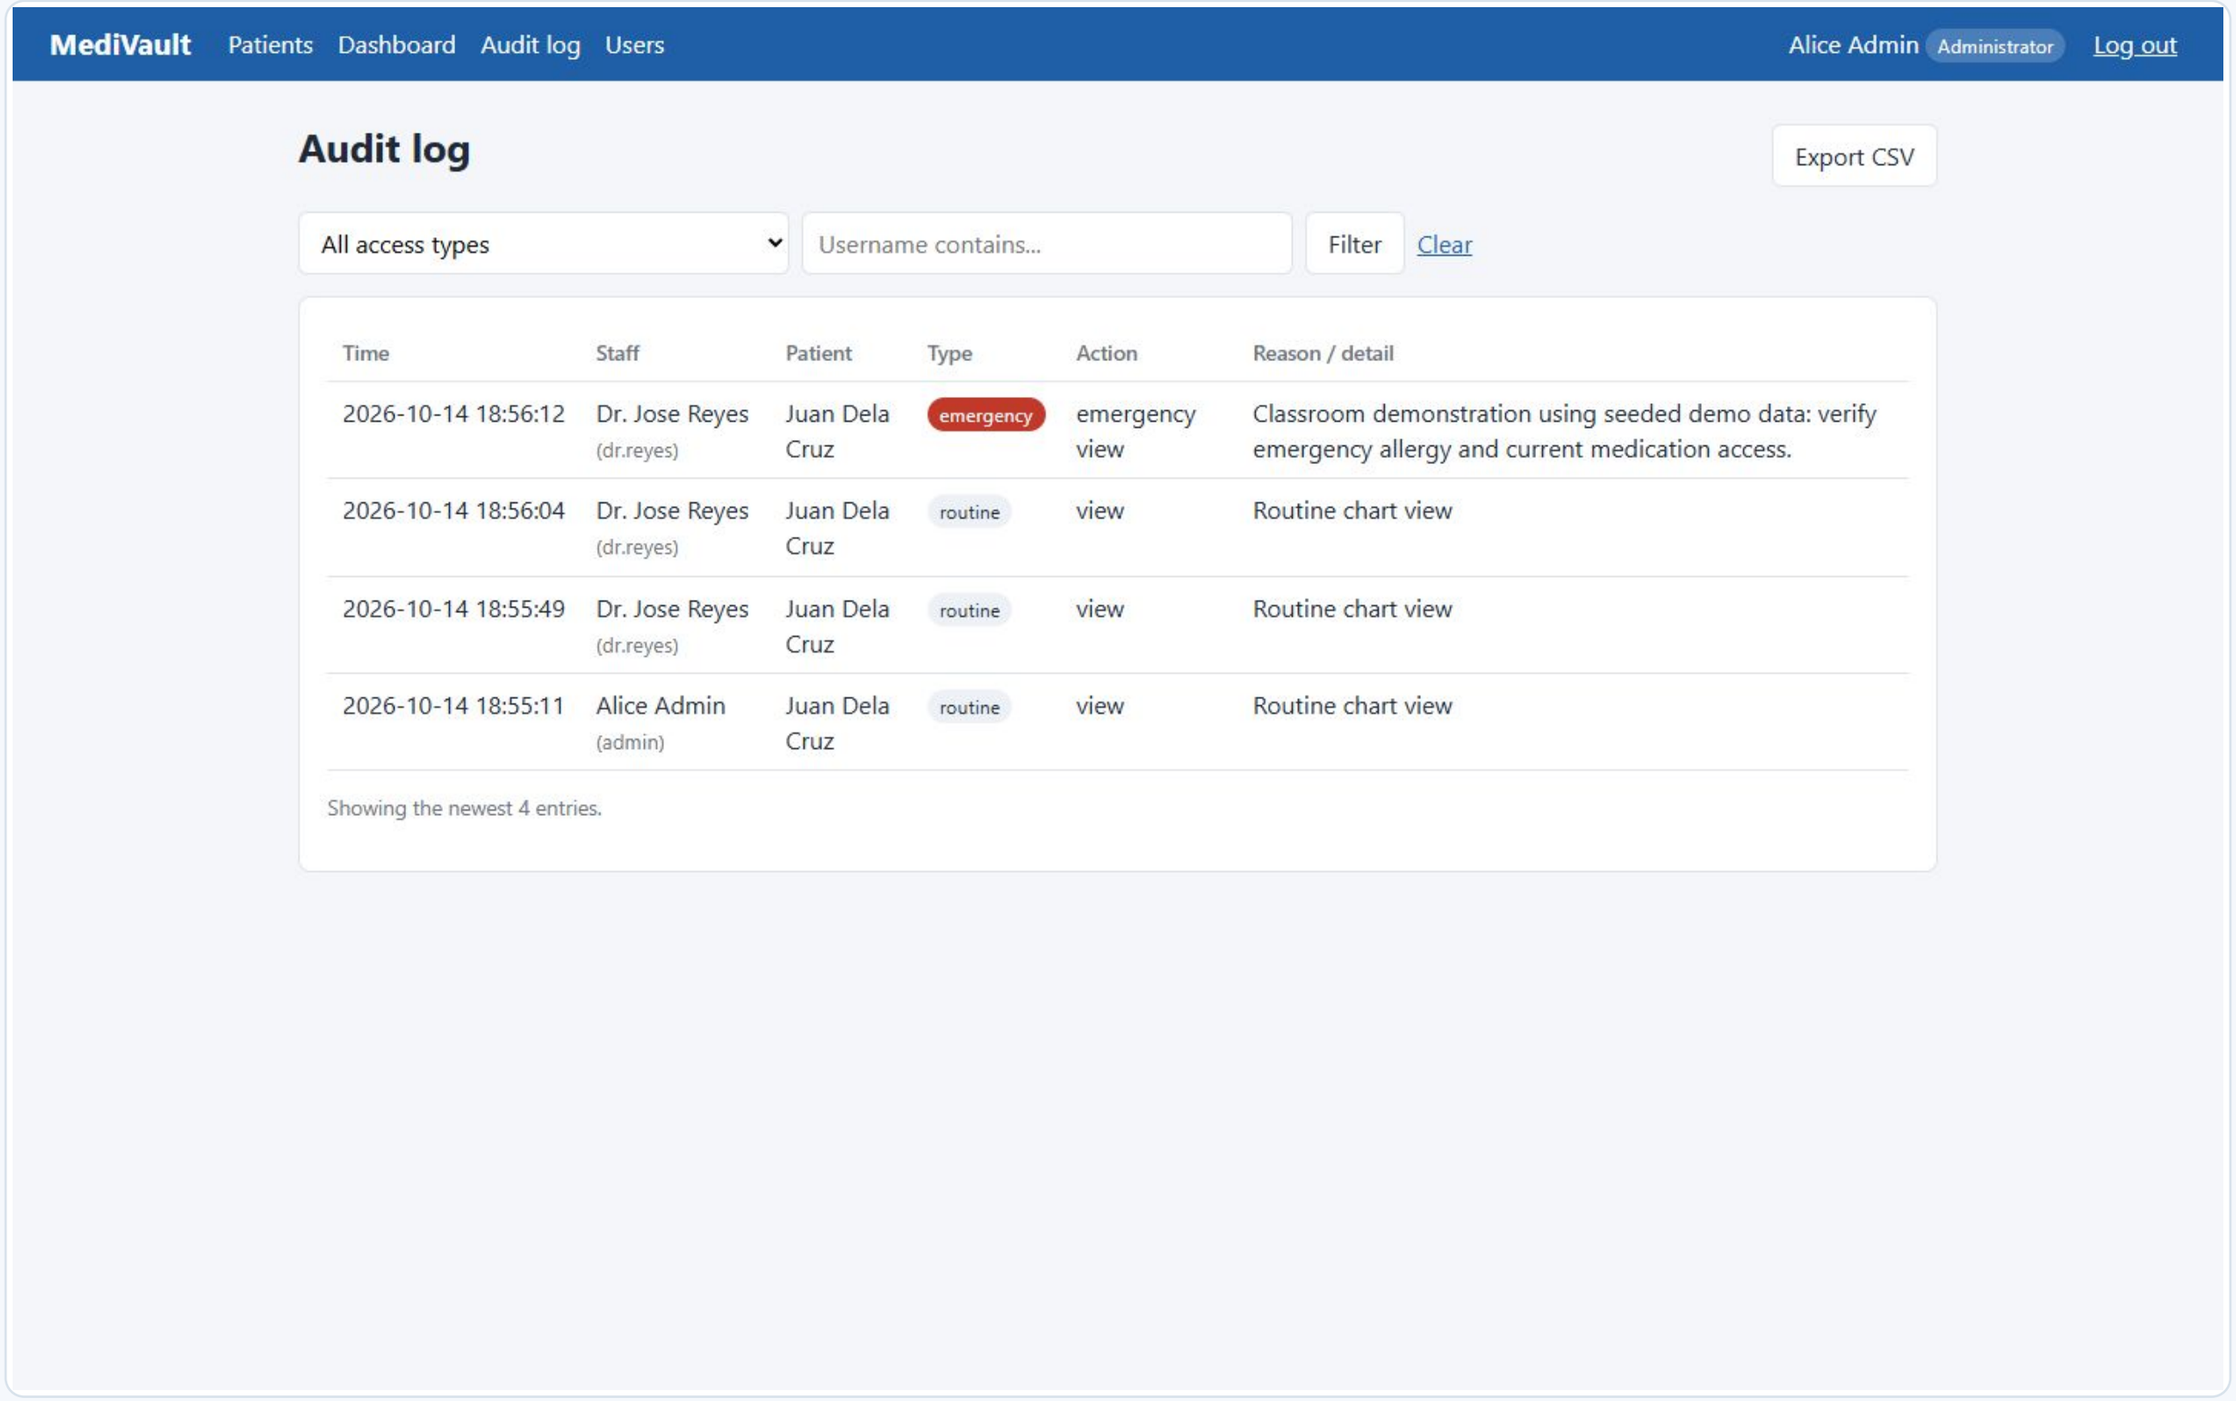

Sign in as an administrator and select **Dashboard**. Review patient and active-staff totals, access counts, and recent emergency accesses. Select **See all** for the emergency audit list.

The displayed totals reflect the seeded records and this documentation walkthrough.

Review and export the audit log

Routine and emergency access are traceable

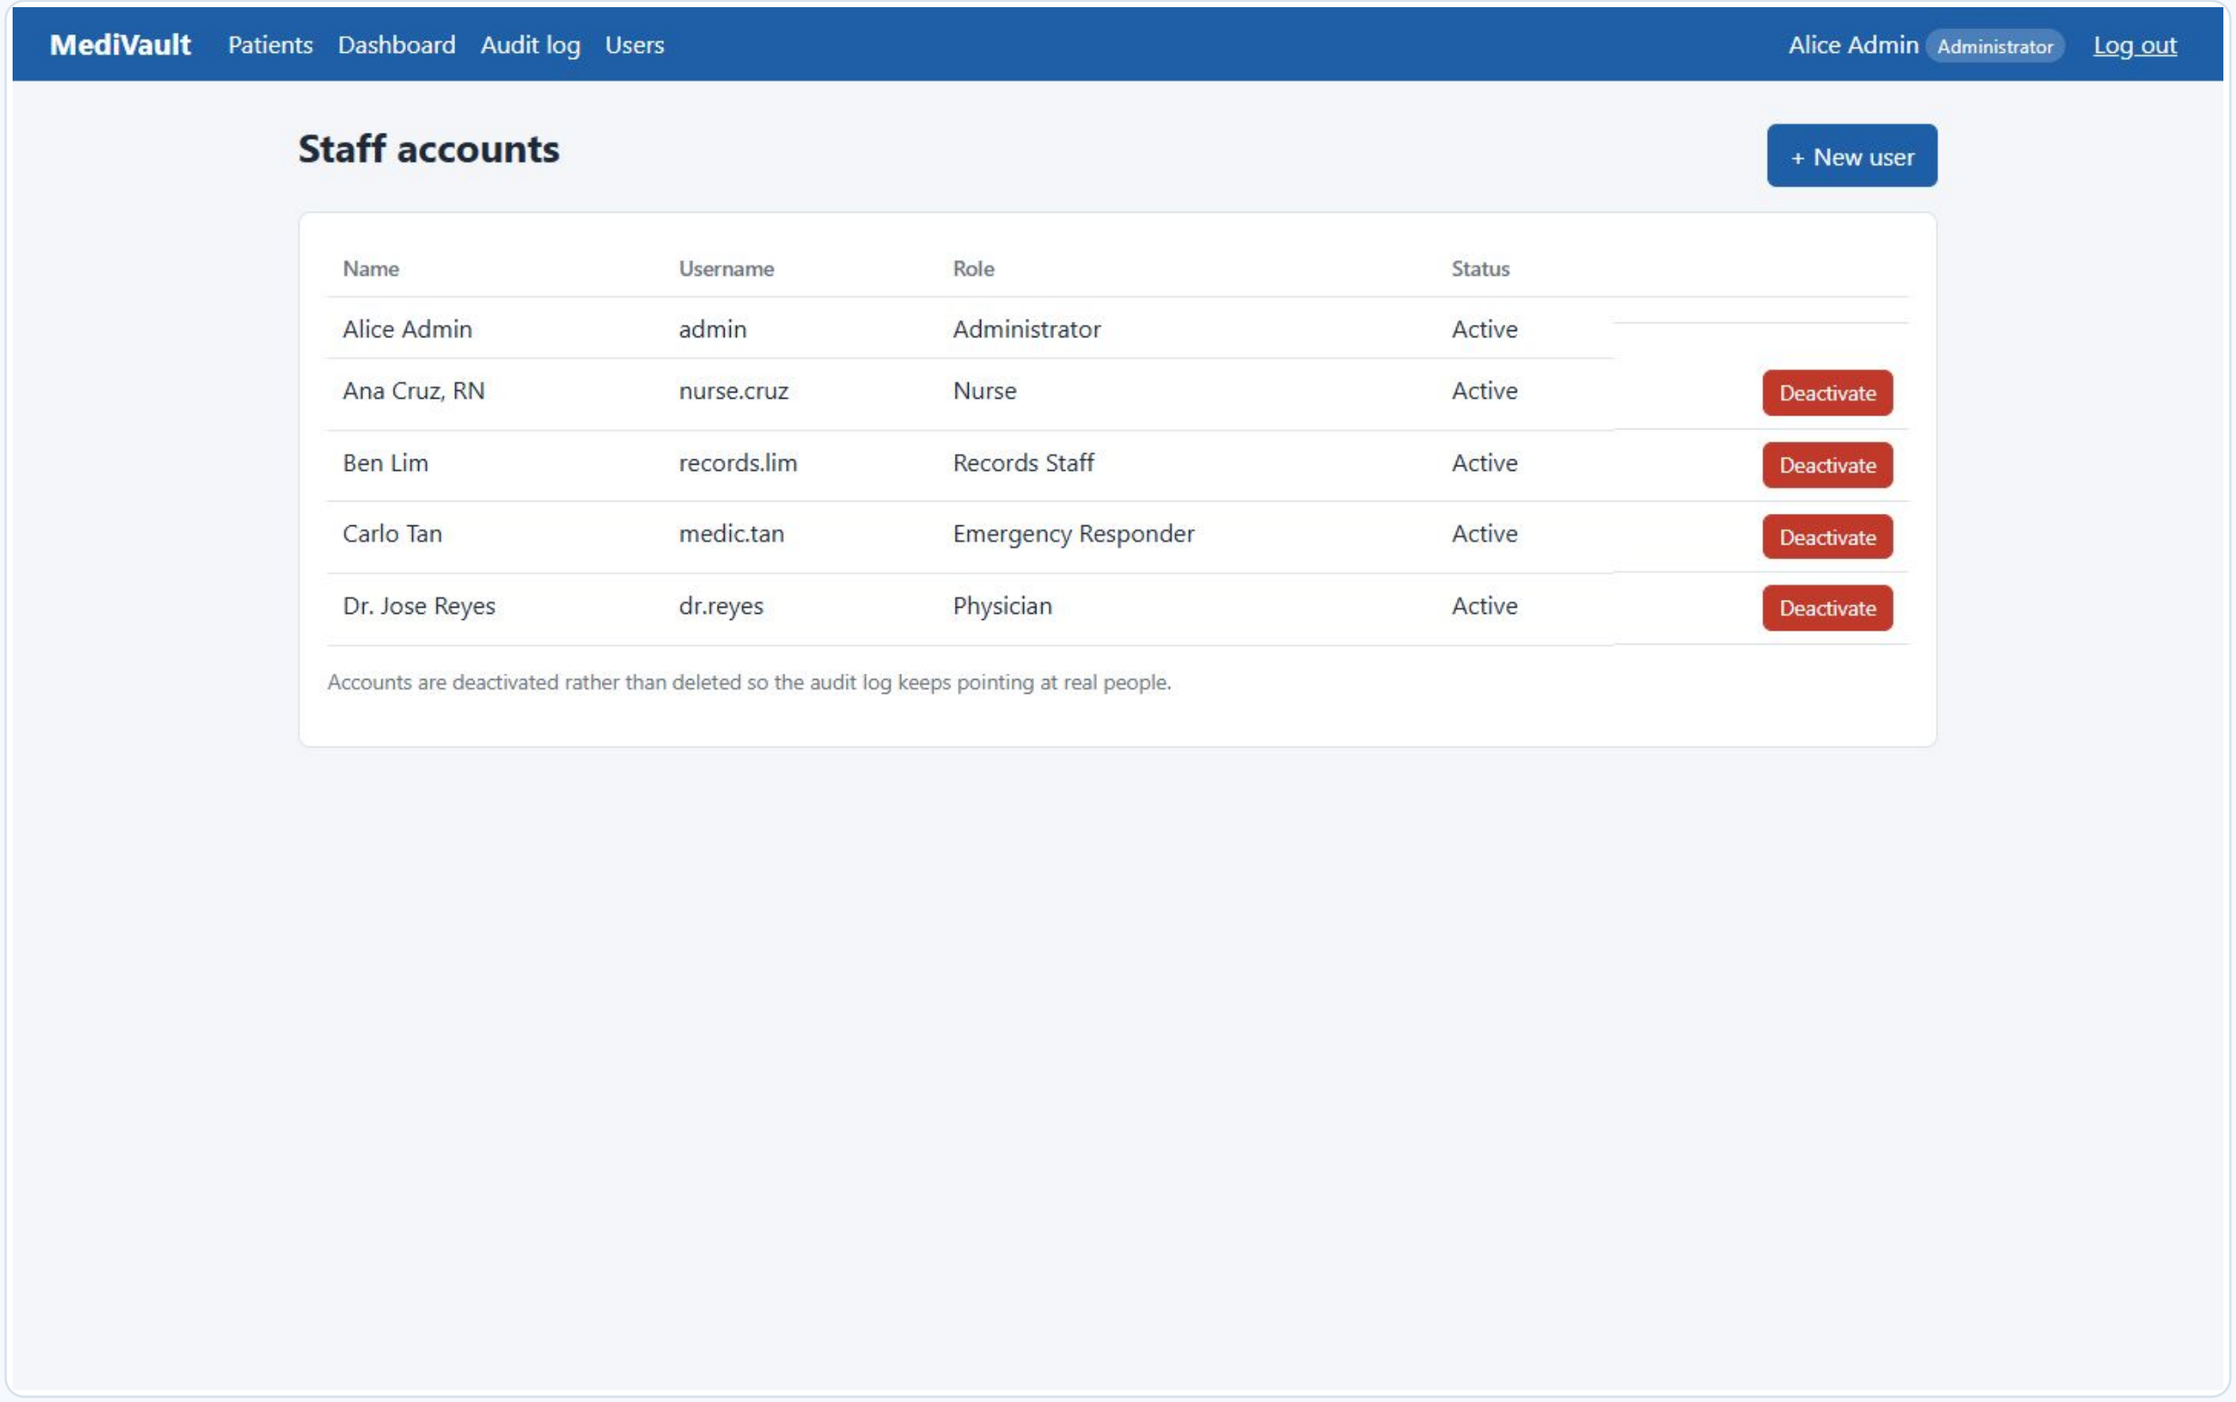

Select **Audit log**. Choose an access type and optionally enter part of a username, then select **Filter**. Select **Export CSV** to download the filtered log.

Each entry identifies the time, staff member, patient, access type, action, and reason.

Manage staff accounts

Administrator-only account management

Select **Users** and **+ New user**. Enter the account details, choose a role, and save. Use **Deactivate** to disable an existing account or **Activate** to restore it.

Accounts are deactivated instead of deleted so past audit entries keep their staff references.

Run the system

Windows setup and daily use

1. Prepare Python

Install Python 3.11 or newer. Open a terminal in the MediVault project folder.

2. Create the environment

If .venv does not exist, run `python -m venv .venv`.

3. Install dependencies

Run `.venv\Scripts\python.exe -m pip install -r requirements.txt`.

4. Start MediVault

Run `.venv\Scripts\python.exe -m flask --app app run --host 127.0.0.1 --port 5000`.

5. Open the browser

Keep the terminal running. Open **http://127.0.0.1:5000** and sign in with an assigned account.

6. Finish safely

Select **Log out** when finished. To stop the local server, press **Ctrl+C** in its terminal.

On first launch, the system creates instance/ with the database, keys, roles, and demo data. Keep the instance folder to preserve records and encryption keys.

If the page cannot load: check that the server is still running, use http (not https), and check for another process using port 5000. A local server started in a restricted sandbox may be unreachable from your browser.

Demo accounts and role guide

Use the account that matches the task

Role	Username	Demo password	Allowed workflow
Administrator	admin	Admin1234	Dashboard, audit logs, staff accounts; patient profiles
Physician	dr.reyes	Doctor1234	Clinical charts, profile edits, medical records, emergency access
Nurse	nurse.cruz	Nurse1234	Read history; maintain allergies and medications; emergency access
Records Staff	records.lim	Records1234	Register, edit, and delete patient profiles
Emergency Responder	medic.tan	Medic1234	Patient lookup and emergency essentials only

Clinical updates

Physicians can add or edit history, allergies, and medications. Nurses can read history and maintain allergies and medications. Records Staff maintain demographic profiles.

Emergency access

Available to physicians, nurses, and responders. Give a clear reason. The system records the access for administrator review.

Account note

These are the project's seeded demonstration credentials. New accounts are created by an administrator. Deactivated accounts cannot sign in.
